

Professional CCTV solutions for network of banks

Novus Security company is known as the producer of modern CCTV systems. The narrow specialization of conducted activity guarantees the best quality and the reliability of offered products. We have experience in realization CCTV systems for objects of the highest safety standards such as banks, military installations, government institutions or state mints. The conception of Novus system monitoring for dispersed objects (networks of institutions, departments, branches) is based on a full centralization of the management system, which allows eliminating the local service.

ATM >> Registration of text data. Displaying and recording against a background of the image from the camera monitoring the cash machine of given transactions (the card and transaction numbers, name of the owner of the card etc.). Possibility of remote searching for the video sequence on the basis of defined key words.

? >> Functions of automatic diagnostics. Recorders are monitoring systematically the state of the system and its individual elements (temperature of disc, damages of partition, assessment of recording process etc.). Depending on administrator settings they activate simultaneous notifying to 5 remote hosts or to the indicated e-mail address.

✉ >> Notifying of events. The recorder can activate the function of notifying of events programmed by the administrator (move detection, alarm input activation, loss of the signal, receipt of the text information from the terminal etc). It allows to optimize the work of operators and to react only to real threats in the object.

📺 >> Remote record. Materials copied in the minibank format take the form of the executable file *.exe with built-in player and possibility of displaying screen in the divisions. In order to protect the information, the access to the file can be limited by the password.

OSD >> Menu settings. All menu settings of the recorder can be made remotely with the help of dedicated software. It allows to eliminate completely the local operation of the recorder, which is a special advantage in case of dispersed systems consisting of several dozen or even a few hundred recorders.

GUI >> Graphical user interfaces (maps). Intuitive work with maps of objects. The possibility of creating individual maps for users, hyperlinking of them and communicating with cameras connected to different recorders.

🌐 >> Connection of „multisite“ type. RAS application is creating the possibility of realization simultaneous connection with 16 recorders. The system has the possibility of remote realization of service functions: software update, loading of settings file and automatic checking the state of the defined group of devices.
